

One normalized field · complementary rendering choices

Hydrogen 3d, $m=0$ · orthogonal slices retain values; the outer 0.15 isosurface retains 3D topology

ORTHOGONAL SLICES

Preserves: Quantitative density values and nodes on three exact planes.

Hides: Every feature that lies away from those planes.

ISOSURFACE

Preserves: One equal-density boundary and its three-dimensional topology.

Hides: Density variation above and below the chosen threshold.

COLOURED GLASS

Preserves: Multiple quantitative slices in a navigable spatial stack.

Hides: Interior structure when translucent planes occlude one another.

All views use the same normalized field · threshold changes visibility, never probability
